

AI Automation ROI Calculator – Client One-Pager

The business problem

Small businesses often spend staff time on repetitive customer questions, routine emails, FAQs, and administrative tasks. The cost is not only salary expense; it also includes time that could be redirected toward higher-value work.

The solution

The AI Automation ROI Calculator gives a quick business-case estimate for an automation opportunity. A prospective client can select a realistic workflow, adjust five assumptions, and immediately see potential savings.

What the calculator measures

- Monthly workload in staff hours
- Hours potentially freed through automation
- Monthly labor-cost savings
- Annual gross savings
- Estimated setup cost
- First-year net benefit
- Estimated payback period
- Estimated annual ROI

Example 1 – E-commerce Customer Support

Assumptions:

- 1,000 repetitive queries/month
- 5 minutes/query
- \$10 staff cost/hour
- 70% automation
- \$500 setup cost

Illustrative result:

- 83.3 manual hours/month
- 58.3 hours potentially saved/month
- ~\$583/month savings
- ~\$7,000 annual gross savings
- ~\$6,500 first-year net benefit
- ~0.9-month payback

Example 2 – Email Management

Assumptions:

- 600 repetitive emails/month
- 8 minutes/email
- \$15 staff cost/hour
- 60% automation
- \$750 setup cost

Illustrative result:

- 80 manual hours/month
- 48 hours potentially saved/month
- ~\$720/month savings
- ~\$8,640 annual gross savings
- ~\$7,890 first-year net benefit
- ~1.0-month payback

Why it matters

The calculator turns an abstract AI idea into a measurable business conversation: how much repetitive work exists, how much may be automated, what the potential savings are, and how quickly the investment could pay back.

Next step for a prospect

Offer a short, no-obligation discovery call to validate the assumptions against the prospect's actual workflow and identify an appropriate automation scope.

All figures are illustrative estimates and should be validated with actual business data.
