

Problems Encountered & Solutions

Problem 1

The calculator needed to be simple enough for a prospective client to understand quickly.

Solution

Used five clear inputs and grouped outputs into business-friendly sections rather than exposing technical calculations.

Problem 2

Preset scenarios needed to provide useful starting values while still allowing customization.

Solution

Added a scenario selector connected to editable input values.

Problem 3

A professional client conversation needs more than one savings number.

Solution

Included hours saved, monthly savings, annual savings, setup cost, first-year net benefit, payback period, ROI, workload reduction, and a recommendation.

Important limitation

The calculator provides estimates. It does not guarantee actual implementation results. Real client data must be validated before making investment decisions.
