

Weekly Progress Report – Week 4

Project

AI Automation ROI Calculator

Objective

Build a client-ready calculator that estimates the potential time and cost savings of AI automation for small businesses.

Work completed

- Defined five business inputs.
- Built a Streamlit-based interactive calculator.
- Added realistic business scenarios.
- Implemented formulas for workload, hours saved, monthly savings, annual savings, net benefit, payback, and ROI.
- Added before/after workload comparison.
- Added financial impact and automation assessment sections.
- Added client-ready summary download.
- Prepared two worked business examples.
- Prepared one-page explainer, presentation outline, and demo script.
- Prepared compliant personalized outreach templates and tracker fields.

Tools

- Python
- Streamlit
- VS Code
- GitHub (if repository is used)

Problems encountered and solutions

1. Need for a lightweight calculator without unnecessary data-processing dependencies.
 - Solution: built the calculator in pure Python + Streamlit without pandas.
2. Scenario values need to update cleanly.
 - Solution: used Streamlit session state and a scenario callback.
3. Client-facing clarity.
 - Solution: organized the app into scenario, assumptions, impact, comparison, financial value, ROI, recommendation, and summary sections.

Evidence to capture

- App home screen
- Scenario selector
- Input section
- Results/KPI section
- Before/after section
- Charts
- Financial impact
- Download summary button
- GitHub repository

Next week

- Validate the model with real business assumptions.
- Collect feedback from team/leader.
- Improve UX based on feedback.
- Explore a small pilot workflow if a qualified prospect is interested.
